

Amendments to the Specification:

[0048] In order to determine the effective concentration of the FirstCure AS amine synergist, each AS was incorporated at concentrations from 1.0% to 3.0%, with the maximum cure determined by MEK double rubs. The concentration of each of the FirstCure AS Series was varied in the test formula (ranging from 1.0% to 3.0%) and results are shown below in Table 5 ~~Figure 2~~. From the results, it was determined that AS-1 was most effective at 2.5%, with AS-3 at 2.0%. Thus, these concentrations of AS were chosen for use as a comparison to the traditional amine synergists.
